Consults

11/10/2013 12:53 PM

Orders: IP Consult to Pediatric Resource Center [131064869], ordered by Logan, Tori, DO at 11/10/2013 2:25 AM**PRC CONSULT****Subjective: 'I am worried about my daughter's safety'****Reason for Consultation:** Mom is worried that 'Madeline has physical symptoms of sexual abuse'**Source of history:** Madeline's Mother - Julia

HPI: Madeline's mother brought Madeline into the ED because she knew that we have special doctor's here (at OSF) and that she has a court case coming up and that she is worried about Madeline's safety. She has seen a doctor before in the past who was not specialized and she is not sure if that doctor can tell that difference between a diaper rash and someone hurting her.

Madeline's mother showed me the photographs of Madeline that she had taken when she had returned home from a visit with her Father - at that time she was worried that someone had molested her daughter because 'her opening down there was bigger than normal'. The photograph was a blurry cell phone photograph that showed the labia with a white substance around the labia - unable to identify - as photograph was very blurry.

Madeline's mother moved into a women's shelter when Madeline was two months old because she and Madeline's father "did not work out". Madeline's father (Kevin Kramer) moved in with his family and Madeline's mother moved out of the shelter after one month of residing here and moved into Madeline's biological grandfather's home. Madeline's mother was worried that after Madeline would go to her father's family's home she would come back with her vaginal area unclean and 'gunky' - this was when Madeline was about three months old.

During this time, Madeline's mother did move back in with Madeline father to 'try to work it out' but it did not work out and she was asked to leave the family property. This is when she was 5 months old. During this time, Madeline's father's family hired a babysitter to mind Madeline (a woman who Madeline's mother did not know). When Madeline was 5 months old, Madeline's mother noticed a change in her behaviour and it was during this time that Madeline started 'diaper squeezing'. Madeline's mother describes diaper squeezing and putting pressure on the front of her diaper by crossing her legs and pushing towards the front area, 'almost as though she is stimulating herself. Like masturbating.' This was during the first week that she was at the baby sitter's house.

Mom noticed that at the end of August (27th or 28th), Mom took Madeline to the Dr's office as she was concerned that Madeline's vaginal opening was 'more open' and that the skin around the opening of vagina was 'red, almost infected looking' and that "I know what

a diaper rash looks like and that was not a diaper rash". This was after the court date, when Madeline's father's family took her after court and stated that they would bring her back Monday (the visit with them was Thursday from Monday, late late at night). She noticed the redness immediately upon changing her diaper when she had her baby returned.

Mom expresses concern that she is with them for a few days only and she has 'these' symptoms. Mom also notes that Madeline's father has threatened to 'murder her' and threatened to 'wipe her off the face of the earth'. She is worried that Madeline's father is a song writer and some of his lyrics are graphic and talk about the 'blood of the innocents'. She also expressed concerns that Madeline's father has brought drugs into her home. But that she "has a sixth sense about these things" and she found them. She also describes a vivid dream where a "spirit told her to trust her instincts" and then the dream continued with someone sexually molesting Madeline during a diaper change and "that's when I knew something was going on over there" (at Madeline father's home)

Mom states "she is doing the best she can with all the millions things she does now". ;" I used to be able to focus more on Madeline, but I hope I can pass some things on to other people the things I have learned"

Individuals present during medical history: Madeline, Madeline's Mother Julia and myself, Dr Kendhari

Past Medical History: Never been hospitalized
Vaginal delivery, at term 40 weeks gestation, 8lbs 20 inches
Discharged with mother after one day

Immunizations: Madeline is unimmunized - Mother does not believe in immunizations at this point - may consider Tetanus in the future

Developmental History: Sits on her own, pulling to stand, cruises along furniture. Says words "mama, dada, baba, up"

Diet History: Formula fed - mom is unsure how many ounces she drinks. She states 'with all this court stress, I am no longer keeping a log. "I go through a can of formula in under a week'. She will eat soft foods - apple sauce, organic baby foods. Mom will allow her to gnaw on apple slices and carrots - but she cannot eat them.

Past Surgical History: No surgeries

Family History: Maternal side: polycystic kidney disease. Maternal grandfather has high blood pressure. NO diabetes, no seizures, no bleeding disorders or nose bleeds or heavy periods. No easily broken bones
On Madeline's father's side, mental illness is present including paternal uncle who is schizophrenic. Madeline's mother suspects that Madeline's paternal grandfather is an alcoholic. Madeline's mother is not aware of any other medical problems on Madeline's father's side

Social History: Mom has custody of Madeline and lives Madeline lives with her. Madeline sees her father 2-4 times a week, in Madeline's mothers home (usually) or at the mall for a

joint visit. Madeline doesn't see her father's family as much

Allergies: No allergies

Review of Systems: No cough, no runny nose, no vomiting, no diarrhea, no rashes, no fever, has been eating and drinking normally. All other systems reviewed and negative unless mentioned in the HPI

Medications:

Head Circumference:

HC Readings from Last 1 Encounters:

11/10/13 46.5 cm (18.31") (95.62%*)

* Growth percentiles are based on WHO data.

Height:

Ht Readings from Last 1 Encounters:

11/10/13 26.38" (6.28%*)

* Growth percentiles are based on WHO data.

EXAM:

Physical Examination:

Madeline is playful, non distressed, playing on the floor of the hospital room eating graham crackers

NC/AT, EOMI, PERRL, MMM, nares patent, graham cracker crumbs on face
TM pearly grey, cerumen noted in L canal
CTA-B, no W/R/R
RRR, S1=S2, no murmur noted, femoral pulses equal and symmetric
Belly soft, NTTP, no masses appreciated, positive bowel sounds
Moves all extremities spontaneously, strength equal and symmetric in upper and lower extremities
Neuro exam: Smiles, says mama during exam, pulling to stand against wall and chair.
Reaches with both hands across midline, good grasp
GU exam: Labia majora with mild erythema, and no excoriation. Annular redundant hymen appreciated, with maternal estrogen effects still present. Anus patent without erythema

Data Review: *I have reviewed all epic medical records including Emergency Room Medical records from OSF St Francis Medical Center and Krieger, Michelle A primary care office. Significant are the notes from nursing staff on 11/8/2013 and 11/9/2013 describing Madeline's mother's concerns about Madeline and Madeline's father's family.

Outside reports reviewed: none

Assessment

Madeline is a nine month old otherwise healthy female who presents with her Mother who has concerns that her daughter has been abused - initial concern in August when Madeline's mother reports that Madeline returned from visiting Madeline's father's home and returned with her vaginal opening appearing larger. Madeline's mother was also concerned about erythema in her vagina that was not a diaper rash. Madeline's mother also feels concerned for Madeline's safety.

Madeline's mother was concerned about Madeline masturbating. Masturbation is not a concern at this age, as developmentally, body curiosity at this age is normal.

Madeline's mother was also concerned about sexual molestation, reporting that the hymenal opening looking larger than it should. The size of the hymenal opening is not a factor in determining if sexual abuse took place.

Madeline had a normal anogenital exam, with the exception of some mild redness to the labia which is a non-specific finding.

A normal exam does not exclude the possibility of sexual abuse as exam following non-acute incidents are sexual are normal greater than 95% of the time. When evaluating concerns for abuse, the history is always the most important element.

Recommendations:

1. Ensure Madeline's safety
2. Will refer to PRC for further work up including colposcopic exam if deemed necessary
3. Will recommend to medical team discharge home today
4. Follow up with DCFS investigation

I have spent 60 minutes in this visit with the patient/family. Greater than 50% of this time was spent on counseling coordination of care.

9 month old female to ED with mother, Julia, who is concerned that pt may have been sexually assaulted possibly by pt's father. Julia states pt was last with father unsupervised around Labor Day of this year but he has had some supervised visitations with pt since then. During Labor Day visit, Julia states father "tried to kidnap her basically, and I had to get the police involved." Julia took pt to her pediatrician at the end of August for redness to vaginal area that was worse after pt stayed with father for a few days. Pt was diagnosed with a diaper rash at this time. Julia believes redness appeared as if pt was "fondled down there" and states "as a mom I know it wasn't diaper rash because it looked different than diaper rash she's had before." Julia reports there were other times that pt would come home after visitation with father with "white gunky stuff down there" or "her little vagina hole looked bigger and was red" and reports approx 3 months ago pt "started squeezing at her diaper and when she would catch her doing it she would tell her 'No!'" Julia states "I did research and that's one of the signs of sexual abuse. She's just a little baby, she should not be masturbating herself." Julia brings camera with pictures of these symptoms she described. This RN did not visualize the pictures. Julia reports "having a dream and seeing it happen" and "a spirit came and told her that her child was being abuse, couldn't she see it?" This when she realized that "it really was happening." Julia states that pt's father "is Satanic. He is very secretive about it but I'm pretty sure he is." Julia reports that some Satanists use "SRA, Satanic Ritual Abuse, and do this to children." Julie voices concern about pt's fathers mother, who "constatnly tries to sneak and see my baby." Julia states last time pt saw father was this evening, supervised by Julia, and they went to coffee together.

Upon physical exam, pt acting age appropriate, smiling and giggling. No bruising, redness, swelling, or other injury noted to vaginal area or other parts of body. Mother states pt has been eating well and having appropriate amount of wet diapers. Breathing even and unlabored. Skin P/W/D. VSS. PEWS score 0.

HOSPITAL COURSE:

Madeline was seen in the ED for suspected child sexual abuse by mother. Mother noticed redness in her diaper area after returning from an unsupervised visit with the child's father September 2nd. There were no new findings to relate acutely. Madeline was admitted for further evaluation by the Pediatric Resource Center. She remained medically stable for her stay. She was discharged home after 1 day after being seen by Pediatric Resource Center as well as DCFS. Mother agreed to plan of care and comfortable with discharge and follow-up.

Consults: Pediatric Resource Center

Consultant recommendations: Discharge home with follow-up with PRC as well as DCFS.

Lab / Imaging Review:

Summary of significant lab and imaging findings:

Lab: none

Radiology: none

DISCHARGE MEDICATION LIST:

There are no discharge medications for this patient.

PCP Notification: Dr. Krieger, Michelle A was notified of the patient's discharge on 12/10/2013 by CHS Service.

Pediatric Admission History and Physical Examination

Admit Date: 11/9/2013

Attending: Elsa Vazquez-Melendez V, MD

PCP: Krieger, Michelle A

Assessment

Madeline Kramer is a 9 m.o. female, no significant PMH, presents to OSF ED with mother for suspected sexual abuse.

Plan

Will admit to general pediatrics for overnight observation with Pediatric Resource Consult.
No continuous monitoring needed as child is stable.

Q4H VS

FEN: formula feeds ad lib, jar baby food ad lib

CC: suspected sexual abuse

History & Physicals (continued)

History of Present Illness

Madeline is a 9 m.o. female, no significant PMH, presents for suspected sexual abuse. She is accompanied by mother.

Mother brings Madeline to OSF ED tonight because she has concerns that Madeline has been sexually abuse while visiting her father's house. Her concerns started at age 4-6 months when Madeline would come home from her father's house looking "dirty" as if she had not been bathed. It was during this period of time she also began "squeeze her diaper area as if she was self-stimulating" after a visit with her father. In August they had a court date to get Dad's name on the birth certificate, it was after this meeting that mother states "he basically kidnapped her and said there was nothing I could do because his name was on the birth certificate now". His last unsupervised visit was September 2nd of 2013, it was after this visit that mom states Madeline came back and she noticed that her vaginal area appeared red and looked as if the opening was larger than previously. Mother denies ever noticing any bleeding, bruising or vaginal discharge. She was evaluated by her primary care physician who diagnosed diaper dermatitis. Patient is eating and drinking normally with no other complaints.

When mother asked why she came to ED tonight for evaluation after being evaluated by PCP and outlying hospital for same complaint she states, "I have an upcoming court date to decide if father will get unsupervised visitation rights and was told there were specialists here who could tell if she has been abused." She has given father supervised visitations with Madeline 2-3 times per week since September 2nd even though "he has threatened to murder me". Mother states "It's like a game I have to play with the legal system" allowing the father to see the baby. She states she is hoping for sole custody after the next court date. Mother states she noticed none of the erythema or abnormal size of the opening today as it occurred two months ago, and that "everything looks normal down there now".

Review of Systems

A 14 point Review of Systems was performed and was negative except as noted in the HPI.

Past Medical, Family, Social History

Birth Hx: SVD with no complications at 40 weeks gestation

PMHx: None per mother

PSHx: No surgeries

FMHx: Mother states that mental illness runs in the father's family including schizophrenia in patient's uncle and suspected in father. Maternal side of family has hypertension.

Social Hx: Extensive court cases regarding child

Living situation: With family, mother and maternal grandfather

Has visitation with father who lives with paternal grandmother and paternal uncle.

School or daycare: stays home with mother during the day

Siblings (number and defining information): 0

Do parents smoke (inside/outside): no

Does the patient smoke/drink/do drugs (if over 12 years old): n/a

Allergies: No Known Allergies

Immunizations:

There is no immunization history on file for this patient.

History & Physicals (continued)

Medications:

No prescriptions prior to admission

Developmental History: milestones have been achieved in a normal sequence and time

Diet/Nutrition: Enfamil Gentlease, also eats organic baby foods

Physical Examination:

Pulse 118 | Temp 97.7 °F (36.5 °C) (Axillary) | Resp 24 | Wt 19 lb (8.618 kg) |
SpO2 99%
Normalized BMI data available only for age 2 to 20 years.
56.97%ile based on WHO weight-for-age data.
No height on file.
No unique date with height and weight on file.

GENERAL: well appearing female, in no acute distress

HEENT: Head: Atraumatic, normocephalic

Eyes: pupils equal and reactive, extraocular eye movements intact

Ear: Normal external auditory canal and tympanic membrane bilaterally

NT: mucous membranes moist, pharynx normal without lesions

NECK supple, no significant adenopathy

CV regular rate and rhythm, S1, S2 normal, no murmur, click, rub or gallop

PULM clear to auscultation, no wheezes or rales, unlabored breathing

ABD Normal appearance, soft, non-tender, without organ enlargement or masses.

GU: normal female, no erythema, ecchymosis or discharge

INTEG: Skin color, texture, turgor normal. No rashes, lesions or ecchymosis.

M/S: no joint tenderness, deformity or swelling, grossly normal

NEURO: alert and oriented, moving all four extremities equally, interacts appropriately with mother and physician, laughs when being tickled

Results Review:

Medication Reconciliation performed in the EMR by Tori Logan, DO: Yes.

Laboratory data reviewed in EMR: labs reviewed and significant for the following: none

Imaging reviewed in EMR: No: none performed. Significant results: n/a

Microbiology pending in Hospital laboratory: none

Consult Orders:

1. IP Consult to Pediatric Resource Center [131064869] ordered by Logan, Tori, DO at 11/10/13 0211

PRC CONSULT

Subjective: 'I am worried about my daughter's safety'

Reason for Consultation: Mom is worried that 'Madeline has physical symptoms of sexual abuse'

Source of history: Madeline's Mother - Julia

HPI: Madeline's mother brought Madeline into the ED because she knew that we have special doctor's here (at OSF) and that she has a court case coming up and that she is worried about Madeline's safety. She has seen a doctor before in the past who was not specialized and she is not sure if that doctor can tell that difference between a diaper rash and someone hurting her.

Madeline's mother showed me the photographs of Madeline that she had taken when she had returned home from a visit with her Father - at that time she was worried that someone had molested her daughter because 'her opening down there was bigger than normal'. The photograph was a blurry cell phone photograph that showed the labia with a white substance around the labia - unable to identify - as photograph was very blurry.

Madeline's mother moved into a women's shelter when Madeline was two months old because she and Madeline's father "did not work out". Madeline's father (Kevin Kramer) moved in with his family and Madeline's mother moved out of the shelter after one month of residing here and moved into Madeline's biological grandfather's home. Madeline's mother was worried that after Madeline would go to her father's family's home she would come back with her vaginal area unclean and 'gunky' - this was when Madeline was about three months old.

During this time, Madeline's mother did move back in with Madeline father to 'try to work it out' but it did not work out and she was asked to leave the family property. This is when she was 5 months old. During this time, Madeline's father's family hired a babysitter to mind Madeline (a woman who Madeline's mother did not know). When Madeline was 5 months old, Madeline's mother noticed a change in her behaviour and it was during this time that Madeline started 'diaper squeezing'. Madeline's mother describes diaper squeezing and putting pressure on the front of her diaper by crossing her legs and pushing towards the front area, 'almost as though she is stimulating herself. Like masturbating.' This was during the first week that she was at the baby sitter's house.

Consult Notes (continued)

Mom noticed that at the end of August (27th or 28th), Mom took Madeline took mom to the Dr's office as she was concerned that Madeline's vaginal opening was 'more open' and that the skin around the opening of vagina was 'red, almost infected looking' and that "I know what a diaper rash looks like and that was not a diaper rash". This was after the court date, when Madeline's father's family took her after court and stated that they would bring her back Monday (the visit with them was Thursday from Monday, late late at night). She noticed the redness immediately upon changing her diaper when she had her baby returned.

Mom expresses concern that she is with them for a few days only and she has 'these' symptoms. Mom also notes that Madeline's father has threatened to 'murder her' and threatened to 'wipe her off the face of the earth'. She is worried that Madeline's father's is a song writer and some of his lyrics are graphic and talk about the 'blood of the innocents'. She also expressed concerns that Madeline's father has brought drugs into her home. But that she "has a sixth sense about these things" and she found them. She also describes a vivid dream where a "spirit told her to trust her instincts" and then the dream continued with someone sexually molesting Madeline during a diaper change and "that's when I knew something was going on over there" (at Madeline father's home)

Mom states "she is doing the best she can with all the millions things she does now". ;" I used to be able to focus more on Madeline, but I hope I can pass some things on to other people the things I have learned"

Individuals present during medical history: Madeline, Madeline's Mother Julia and myself, Dr Kendhari

Past Medical History: Never been hospitalized
Vaginal delivery, at term 40 weeks gestation, 8lbs 20 inches
Discharged with mother after one day

Immunizations: Madeline is unimmunized - Mother does not believe in immunizations at this point - may consider Tetanus in the future

Developmental History: Sits on her own, pulling to stand, cruises along furniture. Says words "mama, dada, baba, up"

Diet History: Formula fed - mom is unsure how many ounces she drinks. She states 'with all this court stress, I am no longer keeping a log. "I go through a can of formula in under a week'. She will eat soft foods - apple sauce, organic baby foods. Mom will allow her to gnaw on apple slices and carrots - but she cannot eat them.

Past Surgical History: No surgeries

Family History: Maternal side: polycystic kidney disease. Maternal grandfather has high blood pressure. NO diabetes, no seizures, no bleeding disorders or nose bleeds or heavy periods. No

EXAM:

Physical Examination:

Madeline is playful, non distressed, playing on the floor of the hospital room eating graham crackers
NC/AT, EOMI, PERRL, MMM, nares patent, graham cracker crumbs on face

TM pearly grey, cerumen noted in L canal

CTA-B, no W/R/R

RRR, S1=S2, no murmur noted, femoral pulses equal and symmetric

Belly soft, NTTP, no masses appreciated, positive bowel sounds

Moves all extremities spontaneously, strength equal and symmetric in upper and lower extremities

Neuro exam: Smiles, says mama during exam, pulling to stand against wall and chair. Reaches with both hands across midline, good grasp

GU exam: Labia majora with mild erythema, and no excoriation. Annular redundant hymen appreciated, with maternal estrogen effects still present. Anus patent without erythema

Data Review: *I have reviewed all epic medical records including Emergency Room Medical records from OSF St Francis Medical Center and Krieger, Michelle A primary care office. Significant are the notes from nursing staff on 11/8/2013 and 11/9/2013 describing Madeline's mother's concerns about Madeline and Madeline's father's family.

Outside reports reviewed: none

Assessment

Madeline is a nine month old otherwise healthy female who presents with her Mother who has concerns that her daughter has been abused - initial concern in August when Madeline's mother reports that Madeline returned from visiting Madeline's father's home and returned with her vaginal opening appearing larger. Madeline's mother was also concerned about erythema in her vagina that was not a diaper rash. Madeline's mother also feels concerned for Madeline's safety.

Consult Notes (continued)

Madeline's mother was concerned about Madeline masturbating. Masturbation is not a concern at this age, as developmentally, body curiosity at this age is normal.

Madeline's mother was also concerned about sexual molestation, reporting that the hymenal opening looking larger than it should. The size of the hymenal opening is not a factor in determining if sexual abuse took place.

Madeline had a normal anogenital exam, with the exception of some mild redness to the labia which is a non-specific finding.

A normal exam does not exclude the possibility of sexual abuse as exam following non-acute incidents are sexual are normal greater than 95% of the time. When evaluating concerns for abuse, the history is always the most important element.

Recommendations:

1. Ensure Madeline's safety
2. Will refer to PRC for further work up including colposcopic exam if deemed necessary
3. Will recommend to medical team discharge home today
4. Follow up with DCFS investigation

I have spent 60 minutes in this visit with the patient/family. Greater than 50% of this time was spent on counseling coordination of care.
